Charge comes in 2 types,  
positive and negative and is  
measured in Coulombs (C). If  
you have a charge on its own  
it emits a field in all  
directions. The field from a  
charge is represented by  $E$   
as in E-lectricity. If you  
put another charge in the  
field it experiences a  
force. Like charges repel  
and unlike charges attract.

To summarise, electrostatics can be described in terms of two vector partial differential equations  $\nabla \cdot \mathbf{E} = \rho / \epsilon_0$  (1.9a)  $\nabla \times \mathbf{E} = 0$  (1.9b) representing four scalar partial differential

## *Electromagnetic Field Theory - Physics Department*

Electrodynamics is creating a magnetic field from an electric current. When electricity passed through a wire, a magnetic field is created around the wire. Looping the wire increases the magnetic field. Adding an iron core greatly increases the effect and creates an electromagnet. You can also create an electromagnet without the iron core.
