The Bionomics of Blow Flies | Annual Review of Entomology

A blow fly relies on carrion as a place to oviposit, feed, and find mates (Norris 1965, Erzinçlioglu 1996, so movement earlier in the day may confer an individual advantage because arriving first...

Blow flies are considered to be diurnal insects and inactive at night [20, 33, 34]. However, some studies found nocturnal activity and even oviposition in blow flies [35–37]. In the current study, *C. megacephala* exhibited a diurnal activity, with a peak in the afternoon (12:00 to 18:00 h). However, the small-scale diurnal activity pattern of flies regarding the time of the day differs across seasons.

NORRIS Commonwealth Scientific and Industrial Research Organization, Canberra, Australia Blow flies (Calliphoridae) include species which cause great losses in the animal industry throughout the world, and some which are vectors of human disease (79). They are, in addition, an important element in the biota, and the study of their bionomics is therefore of considerable practical importance.

In any case, female-biased captures of flies in carrion-baited traps are usually expected (Avancini and Linhares 1988), and such area of bias is frequently considered (e.g., Hwang and Turner 2005; Baz et al. 2007). However, it must be taken into account that every collected carrion fly species does not necessarily show a female-biased sex ratio.

Blow flies are heavily attracted to dead carrion and other dead things. This is because the larvae of Blow flies burrow into and feed on the dead remains. Blow fly larvae need a lot of protein to develop and this is why dead meat is the preferred breeding ground. After 3 weeks to a month the Blow flies larvae will be fully grown.

Calliphora latifrons is one of the most forensically important species of blow flies. Urban entomology deals with the insects that affect humans and their immediate environment. This field includes a variety of problems for humans such as pest control issues and disease. *C. latifrons* is known to freely enter houses.

Calliphora latifrons - Wikipedia

During May 1991 a specimen of *C. megacephala* was incidentally captured near Beaufort West, Cape Province, South Africa, which prompted re-examination of blow-flies captured in the Kruger National Park during 1984. In this way it was found that *C. megacephala* was already well established in the south-eastern Transvaal by mid-1984.

The book provides a taxonomic revision of the Calliphoridae of Fennoscandia and Denmark. Keys, diagnoses, descriptions, summaries of biology and distribution are given for all taxa. Male and female genitalia are fully illustrated. The nomenclature is completely revised. A new subfamily classification based on cladistic principles is proposed.

This account provides the first comprehensive coverage of the insect and other arthropod pests in the urban environment worldwide. Presented is a brief description, biology, and detailed information on the development, habits, and distribution of urban

and public health pests. There are 570 illustrations to accompany some of the major pest species. The format is designed to serve as a ready-reference and to provide basic information on orders, families, and species. The species coverage is international and based on distribution in domestic and peridomestic habitats. The references are extensive and international, and cover key papers on species and groups. The introductory chapters overview the urban ecosystem and its key ecological components, and a review of the pests status and modern control strategies. The book will serve as a professional training manual, and handbook for the pest control professionals, regulatory officials, and urban entomologists. It is organized alphabetically throughout.

Thorough analysis of the scientific and legal issues involved in using insects to help solve crimes.

This text offers insight into the practical applications of microanalytical entomology in the laboratory and in the field of consumer protection. This is the only guide that gives an overview of the subject from initial analysis of a product to interpreting significance of final results. Complete insect illustrations throughout and an insect fragment identification discussion covers all pests that are found in foods. Micrographs illustrate a complete reference on identifying types of hair contaminants found in various foods. Chapters are written by practicing regulatory experts.

The Science of Forensic Entomology builds a foundation of biological and entomological knowledge that equips the student to be able to understand and resolve questions concerning the presence of specific insects at a crime scene, in which the answers require deductive reasoning, seasoned observation, reconstruction and experimentation—features required of all disciplines that have hypothesis testing at its core. Each chapter addresses topics that delve into the underlying biological principles and concepts relevant to the insect biology that forms the bases for using insects in matters of legal importance. The book is more than an introduction to forensic entomology as it offers in depth coverage of non-traditional topics, including the biology of maggot masses, temperature tolerances of necrophagous insects; chemical attraction and communication; reproductive strategies of necrophagous flies; archaeoentomology, and use of insects in modern warfare (terrorism). As such it will enable advanced undergraduate and postgraduate students the opportunity to gain a sound knowledge of the principles, concepts and methodologies necessary to use insects and other arthropods in a wide range of legal matters.

Arthropod transmitted infections continue to be a front-line issue in all regions of the world. Understanding the insects that transmit diseases, the mechanisms of infection and the resulting diseases is vital to doctors, veterinarians, public health workers and disease control agencies. This major reference examines the biology, classification and control of arthropods that cause disease in animals and humans. The morphology, taxonomy and phylogeny of fleas, flies, lice, mites, midges, mosquitoes and ticks are described, with descriptions of their medical and veterinary significance, diseases they cause, insect distribution and global disease spread. Updated, developed and reworked from Doug Kettle's seminal *Medical and Veterinary Entomology*, this major new reference
